Not illustrated. 1917 Excerpt: .form the considerations with which this paper is chiefly concerned. Just such an effect on the physical condition of the soil as described above had been anticipated as the normal result of adding Na₂CO₃ to the soil, for this salt has generally been conceded, by soil experts, to be an active deflocculating agent. But to finde on the other hand, that a similar state of diffusion existed in the soils to which NaCl or Na₂SO₄ had been added appeared wholly inexplicable in the light of the prevailing conception of these salts as agents capable of producing flocculation in the soil colloids. However, this apparent contradiction of wellestablished facts brought out by the field observations becomes more intelligible as the accumulating data define more clearly the conditions necessary to produce the remarkable effects observed. Thus it has been demonstrated, not only in the field but also in the laboratory, that vhe removal from the soil by water of NaCl or Na₂SO₄, together with the water-soluble products of their chemical reaction with the soil constituents, either wholly or in part, is the initial step in creating a condition favorable for the diffusion of the soil colloids and possibly for the formation of new colloidal matter. Therefore the net result of salt application to and subsequent washing of a soil is to render the soil comparatively impervious and to injure seriously its physical condition. The leaching out of added Na₂CO₃ from the soil also presents some interesting phenomena, which...
